
Updated April 19, 2022

Some observers argue the COVID-19 pandemic could be a world-changing event with potentially profound and long-lasting implications for the international security environment. Other observers are more skeptical that the pandemic will have such effects.

In reports issued in March and April 2021, the U.S. intelligence community provided assessments of the potential impact of the pandemic on the international security environment.

 Observers who discuss whether the pandemic will be world-changing for the international security environment have focused on several areas of potential change, including the following, which are listed here separately but overlap in some cases and can interact with one another:

- world order, international institutions, and global governance;
- U.S. global leadership and the U.S. role in the world;
- China’s potential role as a global leader;
- U.S. relations and great power competition with China and Russia;
- the relative prevalence of democratic and authoritarian or autocratic forms of government;
- societal tension, reform, transformation, and governmental stability in various countries;
- the world economy, globalization, and U.S. trade policy;
- allied defense spending and U.S. alliances;
- the cohesion of the European Union;
- the definition of, and budgeting for, U.S. national security;
- U.S. defense strategy, defense budgets, and military operations;
- U.S. foreign assistance programs, international debt relief, and refugee policy;
- activities of non-state actors;
- the amount of U.S. attention devoted to ongoing international issues other than the pandemic; and
- the role of Congress in setting and overseeing the execution of U.S. foreign and defense policy.

Issues for Congress may include whether and how the pandemic could change the international security environment, whether the Biden Administration’s actions for responding to such change are appropriate and sufficient, and what implications such change could have for the role of Congress in setting and overseeing the execution of U.S. foreign and defense policy. Congress’s decisions regarding these issues could have significant implications for U.S. foreign and defense policy.

Introduction

Some observers argue the COVID-19 pandemic could be a world-changing event with potentially profound and long-lasting implications for the international security environment. Other observers are more skeptical that the pandemic will have such effects. This report provides a brief overview of some potential implications the pandemic might have for the international security environment, and appendices listing CRS reports and other writings for further reading.

Issues for Congress may include whether and how the pandemic could change the international security environment, whether the Biden Administration’s actions for responding to such change are appropriate and sufficient, and what implications such change could have for the role of Congress in setting and overseeing the execution of U.S. foreign and defense policy. Congress’s decisions regarding these issues could have significant implications for U.S. foreign and defense policy.

Appendix A presents a list of CRS reports that provide more in-depth discussions of issues presented in this report. Appendix B presents a list of additional writings reflecting various perspectives on these issues.

Background

2021 Assessments by U.S. Intelligence Community

In reports issued in March and April 2021, the U.S. intelligence community provided assessments of the potential impact of the pandemic on the international security environment. Excerpts from these two reports are presented below.

March 2021 NIC Report on Global Trends

A March 2021 report of the National Intelligence Council (NIC) on global trends—the 2021 edition of a report that NIC publishes every four years to serve as an unclassified strategic assessment on key trends that might shape the world over the next 20 years—includes a section on the potential impact of the pandemic, which states:

The COVID-19 pandemic emerged globally in 2020, wreaking havoc across the world, killing more than 2.5 million people as of early 2021, devastating families and communities, and disrupting economies and political dynamics within and between countries. Previous global trends editions forecasted the potential for new diseases and even imagined scenarios with a pandemic, but we lacked a full picture of the breadth and depth of its disruptive potential. COVID-19 has shaken long-held assumptions about resilience and adaptation and created new uncertainties about the economy, governance, geopolitics, and technology.

1 The Office of the Director of National Intelligence states that the National Intelligence Council “supports the Director of National Intelligence [DNI] in his role as head of the Intelligence Community (IC) and is the IC’s center for long-term strategic analysis. Since its establishment in 1979, the NIC has served as a bridge between the intelligence and policy communities, a source of deep substantive expertise on intelligence issues, and a facilitator of Intelligence Community collaboration and outreach. The NIC’s National Intelligence Officers—drawn from government, academia, and the private sector—are the Intelligence Community’s senior experts on a range of regional and functional issues.” (Director of National Intelligence, “National Intelligence Council—Who We Are,” accessed July 9, 2021, at https://www.dni.gov/index.php/index.php?option=com_content&view=article&id=393&Itemid=778.)
To understand and assess the impact of this crisis, we examined and debated a broad range of our assumptions and assessments related to key global trends. We asked a series of questions: Which existing trends will endure, which trends are accelerating or decelerating because of the pandemic, and where are we likely to experience fundamental, systemic shifts? Are the disruptions temporary or could the pandemic unleash new forces to shape the future? Much like the terrorist attacks of 11 September 2001, the COVID-19 pandemic is likely to produce some changes that will be felt for years to come and change the way we live, work, and govern domestically and internationally. How great these will be, however, is very much in question.

ACCELERATING, SHARPENING SOME TRENDS

The pandemic and corresponding national responses appear to be honing and accelerating several trends that were already underway before the outbreak. COVID-19 brought global health and healthcare issues into sharp relief, exposed and in some cases widened social fissures, underscored vast disparities in healthcare access and infrastructure, and interrupted efforts to combat other diseases. The pandemic also highlighted weaknesses in the international coordination on health crises and the mismatch between existing institutions, funding levels, and future health challenges.

Catalyzing Economic Trends. Lockdowns, quarantines, and the closing of international borders have catalyzed some pre-existing economic trends, including diversification in global supply chains, increased national debt, and greater government intervention in economies. Moving forward, the character of globalization may retain some of the changes from this crisis period, and debt, particularly for developing economies, will strain national capacities for many years.

Reinforcing Nationalism and Polarization. Nationalism and polarization have been on the rise in many countries, especially exclusionary nationalism. Efforts to contain and manage the virus have reinforced nationalist trends globally as some states turned inward to protect their citizens and sometimes cast blame on marginalized groups. The response to the pandemic has fueled partisanship and polarization in many countries as groups argue over the best way to respond and seek scapegoats to blame for spreading the virus and for slow responses.

Deepening Inequality. The disproportionate economic impact of COVID-19 on low-income earners has caused them to fall further behind. When COVID-19 is finally controlled, many families are likely to have experienced further setbacks, especially those working in the service or informal sectors or who left the workforce to provide dependent care—predominantly women. The pandemic has exposed the digital divide within and between countries while spurring efforts to improve Internet access.

Straining Governance. The pandemic is straining government capacity for services and contributing to already low levels of trust in institutions in countries that have not effectively handled the response. The pandemic is exacerbating the confusing and polarized information environment that is undermining public confidence in health authorities, particularly in open societies. Illiberal regimes in some countries are using the pandemic as a pretext to more severely crack down on dissent and restrict civic freedoms, conditions that may outlive the disease.

Highlighting Failed International Cooperation. The COVID-19 pandemic exposed the weaknesses and political cleavages in international institutions, such as the World Health Organization (WHO) and United Nations, and called into question countries’ ability and willingness to cooperate multilaterally to address common challenges beyond infectious disease, particularly climate change. The WHO, which has faced significant funding difficulties and resistance to mandatory surveillance regimes, is facing its gravest shock in nearly two decades. The crisis, however, may ultimately lead actors to make deeper

reforms, standardize data collection and sharing, and forge new public-private partnerships.

Elevating the Role of Nonstate Actors. Nonstate actors, ranging from the Gates Foundation to private companies, have been crucial to vaccine research or retrofitting equipment to mass produce medical supplies and personal protective equipment. Nonstate networks will complement national and intergovernmental action in future health crises, including early warning, treatment, facilitation of data-sharing, and vaccine development.

WHILE OTHERS DECELERATE OR REVERSE

COVID-19 is slowing and possibly reversing some longstanding trends in human development, especially the reduction of poverty and disease and closing gender inequality gaps. The longest lasting reversals may be in poverty reduction across Africa, Latin America, and South Asia, followed by losses in gender equality. The resources devoted to fighting COVID-19 and social restrictions could reverse years of progress against malaria, measles, polio, and other infectious diseases by consuming key financial, material, and personnel resources.

The COVID-19 emergency may bring regions together in ways that previous crises have not.

Although European countries early in the crisis imposed restrictions on border traffic and exports of critical medical supplies, the European Union has rallied around an economic rescue package and other emergency measures that could bolster the European integration project going forward. COVID-19 could also lead to redirection of national budgets toward pandemic response and economic recovery, diverting funds from defense expenditures, foreign aid, and infrastructure programs in some countries, at least in the near term.

MORE QUESTIONS THAN ANSWERS

The unanticipated second- and third-order effects of the COVID-19 pandemic have reminded us how uncertain the future is—both in the long and short term. As researchers and analysts, we must be ever vigilant, asking better questions, frequently challenging our assumptions, checking our biases, and looking for weak signals of change. We need to expect the unexpected and apply the lessons of this pandemic to our craft in the future.²

April 2021 DNI Threat Assessment

An April 9, 2021, report from the Director of National Intelligence (DNI)—DNI’s annual threat assessment for 2021—including a section on the pandemic that states (emphasis as in the original):

The COVID-19 pandemic has disrupted life worldwide, with far-reaching effects that extend well beyond global health to the economic, political, and security spheres. We expect COVID-19 to remain a threat to populations worldwide until vaccines and therapeutics are widely distributed. The economic and political implications of the pandemic will ripple through the world for years.

The pandemic is raising geopolitical tensions, and great powers are jockeying for advantage and influence. States are struggling to cooperate—and in some cases are undermining cooperation—to respond to the pandemic and its economic fallout, particularly as some governments turn inward and question the merits of globalization and interdependence. Some governments, such as China and Russia, are using offers of medical supplies and vaccines to try to boost their geopolitical standing.

The economic fallout from the pandemic is likely to create or worsen instability in at least a few—and perhaps many—countries, as people grow more desperate in the face

of interlocking pressures that include sustained economic downturns, job losses, and disrupted supply chains. Some hard-hit developing countries are experiencing financial and humanitarian crises, increasing the risk of surges in migration, collapsed governments, or internal conflict.

- Although global trade shows signs of bouncing back from the COVID-19-induced slump, economists caution that any recovery this year could be disrupted by ongoing or expanding pandemic effects, keeping pressure on many governments to focus on internal economic stability. In April, the International Monetary Fund estimated that the global economy would grow 6 percent this year and 4.4 percent in 2022. This year’s forecast is revised up 0.5 percentage points relative to the previous forecast, reflecting expectations of vaccine-powered strengthening of activity later in the year and additional policy support in a few large economies. The global growth contraction for 2020 is estimated at 3.3 percent.

- The resurgence in COVID-19 infections early this year may have an even greater economic impact as struggling businesses in hard-hit sectors such as tourism and restaurants fold and governments face increasing budget strains.

- The effects on developing countries—especially those that rely heavily on remittances, tourism, or oil exports—may be severe and longer lasting; many developing countries already have sought debt relief.

- The economic fallout from the COVID-19 pandemic, along with conflict and weather extremes, has driven food insecurity worldwide to its highest point in more than a decade, which increases the risk of instability. The number of people experiencing high levels of acute food insecurity doubled from 135 million in 2019 to about 270 million last year, and is projected to rise to 330 million by yearend.

The COVID-19 pandemic is prompting shifts in security priorities for countries around the world. As militaries face growing calls to cut budgets, gaps are emerging in UN peacekeeping operations; military training and preparedness; counterterrorism operations; and arms control monitoring, verification, and compliance. These gaps are likely to grow without a quick end to the pandemic and a rapid recovery, making managing conflict more difficult—particularly because the pandemic has not caused any diminution in the number or intensity of conflicts.

COVID-19-related disruptions to essential health services—such as vaccinations, aid delivery, and maternal and child health programs—will increase the likelihood of additional health emergencies, especially among vulnerable populations in low-income countries. As examples, the pandemic has disrupted HIV/AIDS treatments and preventative measures in Sub-Saharan Africa, as well as measles and polio vaccination campaigns in dozens of countries. World populations, including Americans, will remain vulnerable to new outbreaks of infectious diseases as risk factors persist, such as rapid and unplanned urbanization, protracted conflict and humanitarian crises, human incursions into previously unsettled land, expansion of international travel and trade, and public mistrust of government and health care workers.3

Overview of Areas of Potential Implications

Areas of potential change reflected in writings from observers who discuss whether the pandemic will be a world-changing event include but are not limited to those discussed below. Although these areas of potential change are presented separately, they overlap in some cases and can interact with one another.

3 Office of the Director of National Intelligence, Annual Threat Assessment of the US Intelligence Community, April 9, 2021, pp. 17-18.
World Order, International Institutions, and Global Governance

Some observers have focused on whether the pandemic could cause or accelerate changes to the U.S.-led liberal international order that has operated since World War II, to the international institutions and norms that contribute to it, and consequently to global governance. Changes to the international order and its supporting institutions and norms could affect the international context for addressing not only the pandemic, but other international issues as well.

U.S. Global Leadership and Role in the World

The pandemic could influence discussions over the costs and benefits to the United States of acting as a global leader, not only with respect to global health but across a range of issues.

In the earlier months of the pandemic, some observers focused on how the pandemic may have illustrated the strengths or weaknesses of the Trump Administration’s “America First” approach to the U.S. role in the world. Some observers argued that the pandemic demonstrated that the United States was maintaining or reasserting its role as global leader, while others argued that the pandemic demonstrated that the United States was choosing to withdraw from or was no longer capable of performing that role, and that the pandemic was the first major international crisis since World War II for which the United States did not serve as the leader for spearheading, organizing, or implementing an international response.

Other observers argued that the U.S. response to the pandemic focused international attention on what they view as a need for reform at the World Health Organization (WHO), demonstrated the strength and innovativeness of the U.S. scientific and pharmaceutical establishments in terms of developing and manufacturing vaccines, and demonstrated the flexibility and resiliency of the U.S. federal system in terms of permitting states and localities to respond to the pandemic in ways that are tailored to local conditions.

Some observers, including some foreign observers, argued that the U.S. domestic response to the pandemic has demonstrated weaknesses in U.S. democracy, governance, and public health, particularly in comparison to how certain other countries responded to the pandemic within their own borders, and that this could reduce the ability of the United States in the future to offer itself or be accepted by other countries as a global leader on other international issues or as a model for other countries to emulate. As vaccines have become more widely available in the United States, some observers argued that the United States should export larger numbers of vaccine doses to other countries that need them so as to demonstrate U.S. global leadership and help protect U.S. public health and the U.S. economy by helping to end the global pandemic more quickly.

4 The term *international order* or *world order* generally refers in foreign policy discussions to the collection of organizations, institutions, treaties, rules, norms, and practices that are intended to organize, structure, and regulate international relations during a given historical period.

Other terms used to refer to the U.S.-led liberal international order include postwar international order, rules-based international order, and open international order. Observers sometimes substitute *world* for *international*, or omit *international* or *world* and refer simply to the *liberal order*, the *U.S.-led order*, and so on. In the terms *liberal international order* and *liberal order*, the word *liberal* does not refer to the conservative-liberal construct often used in discussing contemporary politics in the United States or other countries. It is, instead, an older use of the term that refers to an order based on the rule of law, as opposed to an order based on the arbitrary powers of hereditary monarchs.

Though often referred to as if it is a fully developed or universally established situation, the liberal international order, like other international orders that preceded it, is incomplete in geographic reach and in other ways; partly aspirational; not fixed in stone, but rather subject to evolution over time; sometimes violated by its supporters; not entirely free of might-makes-right behavior; resisted or rejected by certain states and non-state actors; and subject to various stresses and challenges.
China’s Potential Role as a Global Leader

Some observers have focused on whether the pandemic is providing insight into whether China desires and is working to become a global leader on par with (or in the place of) the United States, to what degree China has a capacity for doing so, and how other countries might view China acting in such a role. China’s transparency, particularly regarding its actions in the early days of its COVID-19 outbreak in Wuhan and trial data on the efficacy of its vaccines, as well as China’s actions to send vaccines, other medical supplies, and medical personnel to other countries, perhaps for political or diplomatic purposes, became elements of a broader ongoing discussion regarding China’s capacity or suitability for acting as a global leader.

U.S. Relations and Great Power Competition with China and Russia

Some observers have focused on how the pandemic became an element in U.S-China relations, and in U.S. great power competition with China and Russia. For some observers, the pandemic presented an opportunity for U.S.-China cooperation on an important international issue of common interest. For other observers, the pandemic became a source of dispute and an arena of competition between the two countries, and contributed to a hardening of U.S.-China relations into a Cold War-like adversarial situation.

In the earlier months of the pandemic, some observers focused on what they viewed as a competition or race between the United States, China, Russia, and other countries to develop, manufacture, and administer effective vaccines, and thus be able to restore their economies to full operation sooner than other countries. Some observers focused on whether China and Russia were attempting to use exports of their vaccines as levers to gain advantages in their relations with recipient countries. The terms vaccine nationalism and vaccine diplomacy have been used by some of these observers to refer to such perceived activities. Some observers expressed concern that decisions by countries to pursue vaccine development and deployment in a competitive, individual manner rather than a cooperative, multilateral manner could reduce the overall effectiveness of efforts to develop, manufacture, and administer effective vaccines and thereby prolong the global pandemic.

Some observers focused on the pandemic as a factor in the discussion of whether the United States should decouple its economy from China’s and reduce its dependence on China for key materials and products, including hospital supplies and pharmaceuticals. Other observers focused on whether the U.S. and Chinese responses to the pandemic will affect views around the world regarding the relative merits of the U.S. and Chinese forms of government and economic models as potential examples to emulate.

Democracy, Authoritarianism, and Autocracy

Related to the point above about forms of government, some observers have focused on the potential impact of the pandemic on discussions in various countries regarding the merits of democracy compared to those of other forms of government. Other observers have focused on whether the pandemic is providing national leaders with an opportunity or rationale for taking actions to seize greater power and move their countries away from democracy and toward authoritarianism or autocracy, or strengthen or consolidate their already-existing authoritarian or autocratic forms of government.
Societal Tension, Reform, and Transformation, and Governmental Stability

Beyond the specific point above about potential movement toward greater authoritarianism and autocracy, some observers have focused on the possibility that the pandemic more generally could cause increased social tensions in certain countries, could lead to (or present opportunities for) societal reforms and transformations, or could destabilize and perhaps cause the downfall of governments, akin to the effects of certain past world-changing events, such as World War I. Such changes could alter the political orientations, national strategies, foreign policies, and defense policies of the countries in which they occur, potentially inducing follow-on effects among governments and other global actors that interact with those countries.

World Economy, Globalization, and U.S. Trade Policy

Some observers have focused on how the pandemic could change to the world economy, perhaps in ways that could influence the international security environment. Noting that the pandemic affected world trade volumes and disrupted and altered global supply chains, they have focused on the question of whether economic globalization will as a result be slowed, halted, reversed, or otherwise changed. Some observers are monitoring or discussing how such effects could influence or be influenced by U.S. trade policy.

Allied Defense Spending and U.S. Alliances

Particularly during the earlier months of the pandemic, some observers focused on the possibility that costs incurred by U.S. allies—particularly NATO allies in Europe—to support their economies during stay-at-home/lockdown periods could lead to offsetting reductions in their defense expenditures. More generally, some observers during the earlier months of the pandemic asked whether reductions in economic growth caused by the pandemic could lead to reductions in the defense budgets of U.S. allies in both Europe and Asia.

European Union

In the earlier months of the pandemic, some observers focused on the question of whether the pandemic was creating tensions—or, conversely, opportunities for greater coordination—among the European Union member states, and what impact the pandemic might ultimately have on the cohesion of the European Union and its ability to take effective actions on the international stage.

Definition of, and Budgeting for, U.S. National Security

Some observers focused on whether the pandemic would (or should) lead to a revised definition of U.S. national security, particularly one that is less military-centric and more focused on what are sometimes called human-security-oriented challenges or global issues, such as climate

---

change, that have sometimes been more at the periphery of U.S. national security policy and plans. Such a change in definition could lead to a changed allocation of funding between the Department of Defense (DOD) and other government agencies that perform national-security-related tasks, a realignment of resources within DOD between combat-oriented programs and other programs (such as those related to DOD’s mission of providing defense support of civil authorities), and perhaps a changed allocation of funding among the agencies other than DOD that perform national-security-related tasks.

Particularly during the earlier months of the pandemic, some observers focused on the question of whether large federal expenditures made in response to the domestic U.S. economic effects of the pandemic, and the impact of these expenditures on the federal budget deficit and federal debt, could lead to greater constraints in coming years on U.S. defense spending levels. As a follow-on matter, these observers additionally focused on the question of whether responding to such increased constraints would (or should) lead to revisions in U.S. defense strategy, changes in U.S. defense programs, and a reduction or termination of certain overseas U.S. military operations.

**U.S. Foreign Assistance, International Debt Relief, and Refugee Policy**

Some observers have focused on the question of whether the pandemic is providing a new lens through which to measure the value of U.S. foreign assistance, international debt relief, and refugee policy in promoting U.S. interests, particularly in connection with the previously mentioned issue of whether to revise the definition of U.S. national security to make it less military-centric.

**Non-state Actors**

Some observers have focused on how non-state actors such as international terrorist and criminal organizations are reacting to the pandemic, and on how much priority should be given to countering such actors in the future, particularly in a context of a changed definition of U.S. national security.

**U.S. Attention to International Issues Other than the Pandemic**

Particularly during the earlier months of the pandemic, some observers focused on whether responding to the pandemic was affecting the time and resources that U.S. leaders and agencies could devote to addressing other international issues of concern to the United States that predated but continued to exist in parallel with the pandemic. In the earlier months of the pandemic, U.S. officials warned other countries to not take actions during the pandemic to challenge U.S. interests around the world or otherwise test U.S. resolve or responsiveness on the thinking that the pandemic was distracting the U.S. government from other concerns or reducing U.S. capacity for responding to any such challenges.

**Role of Congress**

In the earlier months of the pandemic, a few observers focused on the issue of how the pandemic had affected Congress’s activities for conducting oversight of the Administration’s foreign policy actions.
Appendices with CRS Reports and Additional Writings

For further reading on the topics outlined above, see the CRS reports presented in Appendix A and the additional writings presented in Appendix B.

Potential Issues for Congress

Potential issues for Congress regarding implications of the pandemic for the international security environment and the U.S. role in the world include but are not limited to the following:

- Will the pandemic change the international security environment, and if so, in what ways? How clearly can potential changes be anticipated? What insight into these questions, if any, can be provided by past major world events such as World Wars I and II and the 1918 influenza pandemic?

- How should the United States respond to potential changes in the international security environment arising from the current pandemic and its effects, particularly in light of uncertainty regarding the precise nature and likelihood of these changes? How might U.S. action or inaction influence or accelerate these changes?

- What does the pandemic demonstrate about the role of the United States as a global leader? What impact, if any, will the U.S. domestic response to the pandemic have on the ability of the United States in the future to offer itself or be accepted by other countries as a global leader on other international issues, or to serve as a model for other countries to emulate in terms of their own political systems, governance, and economic models?

- What actions is the Administration developing to respond to potential changes in the international security environment arising from the pandemic? Does Congress have sufficient visibility into these actions? Are these actions appropriate and sufficient? What metrics should Congress use to assess them?

- What implications do potential changes in the international security environment arising from the pandemic have for the role of Congress in setting and overseeing the execution of U.S. foreign and defense policy? Is Congress appropriately organized for maintaining Congress as a co-equal branch of government relative to the executive branch in addressing these potential changes? If the pandemic becomes a world-changing event for the international security environment and the U.S. role in the world, what implications, if any, might that have for congressional organization and operations?

Appendix B. Additional Writings

In presenting sources of additional reading, this appendix includes some examples of writings reflecting various perspectives on the potential implications of the pandemic on the international security environment and the U.S. role in the world, organized by specific themes or topics. Within each section, the items are presented in chronological order, with the most recent on top. For most of the sections, additional citations with dates earlier than that of the last item listed in the section can be found in previous versions of this CRS report.
